

SUBJECT: War in Middle East: MedicCleanAir – Infection Control Units

TITEL: more and more interest from Middle East in Infection Control Units of Flanders Company

Resulting from the participation at the Arab Health Exhibition held at Dubai in January, Middle East companies show more and more interest in the distribution of the MedicCleanAir – Infection Control Units. The war situation in the Middle East region lies at the basis of this urgent demand. Due to the possible risks that the current war may bring, such as airborne contamination caused by 'burning oil fields', as well as the fear for bacterial warfare, the devices are eagerly required, not only by hospitals, but also by local companies, as well as private citizens to protect their homes as much as possible.

MedicCleanAir Pro – Infection Control Unit – eliminates particles as well as gases. The filter cartridge of the Unit consists of a particle filter Hepa 14, which is the highest level in Hepa filtration and an activated carbon filter to eliminate gases with an adsorption capacity of 90,000 sq.m..

Apart from the technical features of the unit, the major reason for this exceptional interest in the Middle East is the fact that the MedicCleanAir Units are supported by the international medical society, like the Hospital Infection Society and the Bone Marrow Transplant.

All together, this mobile air-cleaning device is an effective measure to protect people from the hazards of the dangerous airborne contamination that threatens life in the Middle East.
